This innovative volume provides a comparative and diachronic analysis of the main works of outstanding European poets of different eras, nationalities, cultures, and religions. By tracking the use of the most common nouns (key concepts) within and between the works of Homer, Virgil, Dante, Shakespeare, Pushkin, and Goethe (in their original languages), the author reveals previously unknown facts and hidden patterns in their language.

The book takes as its starting point the axiom of French poet Charles Baudelaire: “To understand the soul of a poet, or at least his main concern, let us search in his works to see which word or words are most often represented there.”

By tracing the evolution of key concepts through their frequency of use in the texts of outstanding European poets over time, the reader gains access to areas of poetic consciousness that were previously inaccessible.

This type of study has only become possible in the digital era of the 21st century thanks to the advent of new computer technologies and linguistically marked corpora of poets’ texts. This book can serve both as a textbook and a long-term reference work for students and scholars specializing in computational and corpus linguistics, cross-linguistic comparative literature, lexicology and semantics, poetics, and cultural studies.

In addition, the book examines and compares poems written by various artificial intelligence programs: ChatGPT, Gemini, Claude, and DeepSeek.

*'National literature is not worth much now. We are now entering the epoch of world literature, and everyone must now help to hasten the appearance of this epoch.'*
